

# Running Service App

Kindly follow the following guidelines to run the app.

1. Create **database** named **serviceapp** or change the name of the database in the **.env** file to reflect your own database's name.
2. Run **php artisan migrate** to migrate the database tables that manage the users, services, file uploads etc.
3. Run **php artisan db:seed** to seed the credentials for the Administrator automatically into the database. This is necessary for authentication.
4. Run **php artisan serve** to serve the project locally and open in browser.
5. The **login page** requires **email** and **password**. Use the following credentials.
  - a. Email: [jockosims@gmail.com](mailto:jockosims@gmail.com)
  - b. Password: secretNB: You can also locate the credentials in the **database/seeds/AdminSeeder.php** file in the project files.

Thank you!
